

Newco Infinibrew

FULLY AUTOMATED FRESH BREWED COFFEE SYSTEM

A New Vision of Small-Batch Brewing

Imagine endless amounts of perfectly brewed coffee, all without the need for anyone to brew or monitor.

Meet the Infinibrew Automated System: fully automated to grind, brew, and maintain just the right amount of coffee at just the right temperature. Give your staff a break.

As customers draw from the integrated smart servers the Infinibrew automatically grinds and brews fresh coffee in small batches to maintain optimal levels.

Quality in the Cup

The Infinibrew machine can automatically dispose of previously brewed coffee and brew fresh on it's own, alleviating the need for staff to constantly check for stale coffee in order to avoid dissatisfied customers.

Elevate The Senses

Grinding coffee beans fresh at time of brewing is the ultimate guest experience when it comes to enjoying coffee. Even non-coffee drinkers enjoy the aroma of freshly ground coffee. Offering a whole bean program will increase customer perception and drive repeat sales.

Scheduled Brewing

Weekday and weekend schedules can vary and provide just right volume of coffee based on the demand. Drain schedules can also be set to dispose of coffee after the quality hold time has expired.

Reduce Waste

The key is small batches, brewed to perfection, at just the right volume to meet the needs of each location. Since coffee is automatically brewed as it is being consumed, substantially less overall volume is required to meet the demand.

Staffing Matters

Customer engagement vs. managing the daily brewing and cleaning? The choice is clear and now its within reach.

Infinibrew

Clean-In-Place

Our clean in place feature allows servers to remain on the brewer while the entire brewing system is cleaned, rinsed and drained and ready for the next wave of customers. No more trips to the sink with servers that get dropped and damaged.

Smart 1.5 Gal Servers

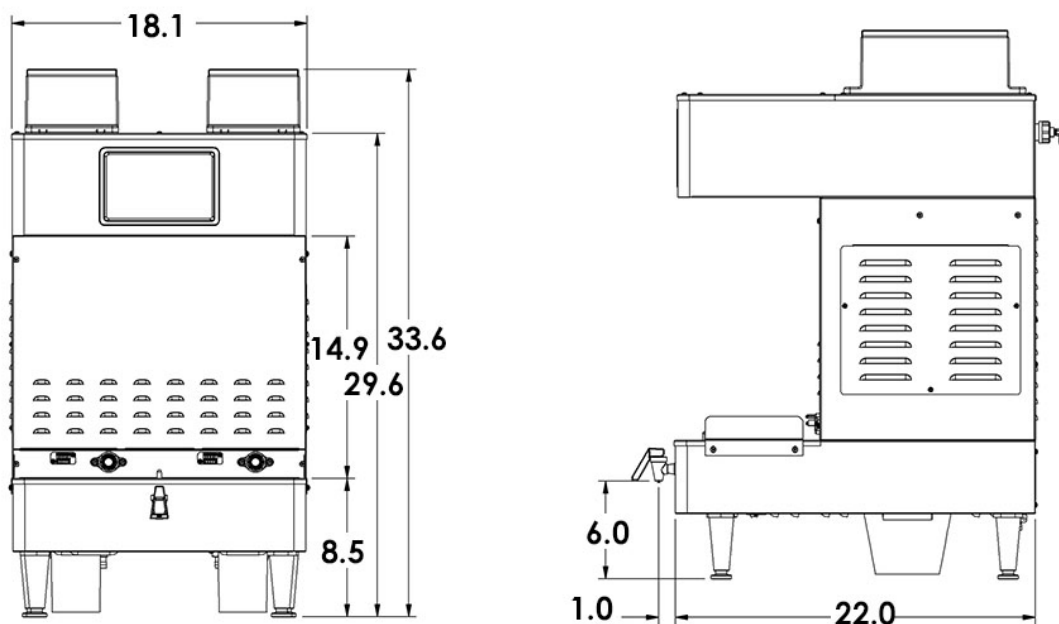

Digital servers display the volume of coffee through the LED lights. Integrated radiant pulse heater keeps coffee fresh while maintaining a proper serving temperature. As coffee levels drop, the server calls for fresh coffee to be brewed.

Brewing Mechanism

Our innovative brewing system is equipped to handle 40 grams of ground coffee in a single brew cycle. A permanent mesh filter delivers a clean, drip style cup of coffee while eliminating the troubles of traditional paper filter systems. Programmable air infusion speed and time in three brew phases perfectly extracts the nuances of each coffee selection.

Maintenance and Service

Extensive research and development has been dedicated to the layout of all components. Most repairs can be performed from the front and top of the machine with ample room for component diagnosis and exchange.
