

Newco Infinibrew

A FULLY AUTOMATED COFFEE SYSTEM

A New Vision of Small-Batch Brewing

Imagine endlessly available, perfectly brewed coffee, produced effortlessly.

Meet the Infinibrew Automated System: fully automated to grind, brew, and maintain just the right amount of coffee, at just the right temperature, forever. Let your team focus on the rest of the business, the Infinibrew will handle the coffee.

As customers draw from the integrated smart servers, the Infinibrew automatically grinds and brews fresh coffee in small batches to maintain optimal levels. Grounds drop away via chutes for clean, under-counter disposal.

Quality in the Cup

The Infinibrew system can automatically dispose of previously brewed coffee and prepares a fresh batch on its own, avoiding dissatisfied customers and the need for staff to regularly check for stale coffee.

Elevate The Senses

The aroma of freshly ground coffee beans provides the ultimate guest experience when it comes to enjoying coffee. Even non-coffee drinkers enjoy the scents produced by regular grinding, and the sensation increases customer awareness and drives repeat sales.

Scheduled Brewing

Independent weekday and weekend scheduling allows you to control your desired volume of coffee, based on demand. Drain schedules can also be set to dispose of coffee after the programmed hold time has expired.

Reduce Waste

The key is small batches, brewed to perfection, at just the right volume to meet the needs of your individual locations. Since coffee brews automatically as it is being consumed, less overall volume is required to meet demand, meaning when demand drops, you aren't left with large brews to dump.

Staffing Matters

Tired of weighing customer engagement vs. the demands of daily brewing and cleaning? Let your team focus on guests, as you relax, knowing that coffee is under control.

Infinibrew

Clean-In-Place

Our clean-in-place feature allows servers to remain on the brewer while the entire brewing system is cleaned, rinsed, and drained. The Infinibrew then brews a fresh pot, keeping you ready for the next wave of customers. No more trips to the sink with servers that get dropped and damaged.

Smart 1.5 Gal Servers

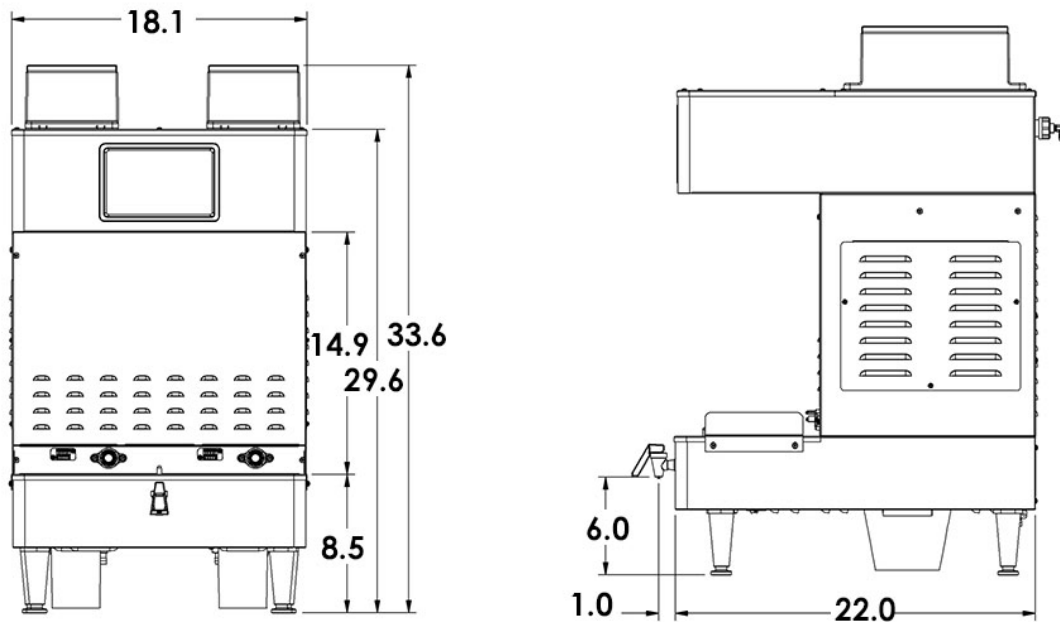

Digital servers display the volume of coffee via LED lights. An integrated radiant pulse heater keeps coffee fresh, while maintaining a proper serving temperature. The server detects levels dropping while in use, then tells the system to replenish coffee.

Brewing Mechanism

Our innovative brewing system is equipped to handle 40 grams of ground coffee in a single brew cycle. A permanent mesh filter delivers a clean, drip-style cup of coffee, while eliminating the mess of traditional, paper filter systems. Programmable air infusion uses speed and time, in three brew phases, to perfectly extract the nuances of each coffee selection quickly.

Maintenance and Service

Extensive research and development has been dedicated to the layout of all components. Most repairs can be performed easily in place, utilizing convenient front and top access to the machine. This machine requires a water supply, a drain line, and counter cut-outs for grounds disposal chutes.
